

PFBC Fish Habitat Management

Habitat Management

Do you like to build things? PFBC's Habitat Management staff work together with community partners to enhance PA waterways by building fish habitat in lakes and streams. A few types of habitat structures in streams and lakes, not only provide "homes for fish", but also help stabilize banks and decrease sedimentation from impacting the waterways. PFBC's biologists first study the waterway and determine the best location for habitat structures to be placed. Then they design those structures and work with community partners to build the structures. **LEARN MORE** by **READING** PFBC's - [PLAY – Careers With PA Fish and Boat Commission](#), and/or [PLAY – Good Fishing Needs Good Habitat!](#)
